

## Accessing and Interpreting Screening Data

The universal screening data are uploaded into the dropbox in a subfolder titled "Screeners completed." In this subfolder, you will find each school's individual excel files that include their results. Specifically, there are four tabs at the bottom: Externalizing only, internalizing only, combined at-risk, and summary. Teams will explore each of these tabs when reviewing their data. The summary tab includes the number and percent of students. This tab will allow teams to examine their overall percentage of students who have been detected as at-risk in their school. Basically, it provides a way of examining the quality of Tier 1. Too many at-risk students doesn't mean more individual interventions, it means improvement of Tier 1 implementation. Diana will discuss and model this thought process.

You will also find two additional documents in the sub-folder. One of the documents is the powerpoint with aggregated results. This powerpoint discusses the purpose of screening and briefly how to go about using the data to make decisions (team confirmation process, triage students, identify Tier 1 needs, match to Tier 2 interventions, etc.). I've also included some instructions in the powerpoint that discusses the aggregated results of the screener across schools. The last document is a Word document that outlines how to conduct a team confirmation process.
